

helical scalp treatment

treat superficial lesions better than electrons

Patient Before

The patient was treated for skin cancer of the forehead. The prescribed dose: 2.0 Gy per fraction/60.0 Gy total.

The Plan

Dose Quality Assurance

"An *in vivo* dosimetry measurement was made with three thermoluminescent dosimeters on the patient. The attached picture shows the approximate location of the TLDs. The measured dose per fraction is within 5% agreement based on the predicted dose."
